**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

## Office Action Summary

**Application No.**

10/532,944

**Applicant(s)**

GRAY ET AL.

**Examiner**

GANAPATHIRAMA RAGHU

**Art Unit**

1652

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 29 October 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) See Continuation Sheet is/are pending in the application.
- 4a) Of the above claim(s) See Continuation Sheet is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1, 46, 56-58, 61 and 133 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

Continuation of Disposition of Claims: Claims pending in the application are 1,46,56-58,61,64,66,68,70,73,125,126,130,131,133,135,137,138,140,157,161,169,171,218,221,225,229,231-234,236,241 and 271-274.

Continuation of Disposition of Claims: Claims withdrawn from consideration are 64,66,68,70,73,125,126,130,131,137,138,140,157,161,169,171,218,221,225,229,231-234,236,241 and 271-274.

***Application Status***

In response to the Office Action mailed on 05/30/08, applicants' response filed on 10/29/08 is acknowledged. Said response, amended claims 1, 58, 61, 68, 73, 157, 231, 233, 236 and 271, added new claim 274.

In said response, applicants' have: i) acknowledged the submission of incorrect sequence list (inadvertent error) with the National Phase of the instant application and ii) submitted the correct sequence list from the original PCT Application No. PCT/US2003/033150 along with the response dated 10/29/08 and have requested that a new search and examination be performed on the correct SEQ ID NO: 7. The request by the applicant has been considered favorably by the examiner.

Furthermore, in the light of the instant amendment, applicants have argued that "unity of invention exists between the restricted groups (Groups II to XXII) with the elected Group I, as all the claims are closely related and also possess novel inventive concept and can be properly added back to elected Group I.

Applicants' arguments are answered as follows.

Applicant's arguments that all the claims are linked by special technical features and have unity of invention is not persuasive, because broadest interpretation of claims, especially claim 1, part (d) "a nucleic acid sequence encoding an enzymatically active fragment thereof, wherein the polypeptide or fragment thereof has amylase activity" is being interpreted by the examiner as follows: It should be noted that part (d) of claim 1 being directed to a nucleic acid

Art Unit: 1652

sequence encoding a polypeptide of SEQ ID NO: 8 or an enzymatically active fragment thereof, in broadest reasonable interpretation encompasses not only SEQ ID NO: 8 but any fragment within SEQ ID NO: 8 due to the recitation of “a” and “fragment thereof”. It is deemed to encompass and read on “any two/dipeptide sequences of SEQ ID NO: 8. Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073) disclose an isolated polynucleotide encoding a polypeptide (Q59005) annotated as a putative amylase/glycosidase belonging to glycosyl hydrolase 15 family with glycosyl hydrolase activity (entire document and see provided sequence alignment), said reference polypeptide comprises many fragments of SEQ ID NO: 8 of the instant application and the recited activity of claim 1 part (g), for example, the following amino acid residues/fragments of the reference polypeptide (Q59005); 111-122 and 517-537 correspond to the fragment (100% best local similarity to SEQ ID NO: 8 or enzymatically active fragment thereof) found in SEQ ID NO: 8 of the instant application at positions 109-120 and 519-540. Therefore, the disclosure of Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073) is deemed to anticipate claims 1, 46, 56-58 and 61 in part of the instant application.

Therefore, the technical features linking the inventions of Groups I-XXII does not constitute a special technical feature as defined by PCT Rule 13.2, as it does not define a contribution over the prior art. Further evidence that the claims lack special technical feature is found under U.S.C. 102 (b) rejection below. In addition, as cited in the Office action dated 01/18/08 (Requirement for Restriction), the PCT does not provide for multiple products or methods within

Art Unit: 1652

single application, therefore, unity of invention is lacking with regard to Groups I-XXII; see 37 CFR 1.475. 37 CFR 1.475 (d) also states: If multiple products, processes of manufacture or uses are claimed, the first invention of the category first mentioned in the claims of the application and the first recited invention of each other categories related thereto will be considered as the main invention in the claims, see PCT Article 17(3)(a) 1.47(c).

Hence, for the above cited reasons searching of all claims is a serious search burden and contrary to applicant's argument, the requirement is still deemed proper and is therefore made FINAL.

Claims 1, 46, 56-58, 61, 64, 66, 68, 70, 73, 125, 126, 130, 131, 133, 135, 137, 138, 140, 157, 161, 169, 171, 218, 221, 225, 229, 231-234, 236, 241 and 271-274 are pending in this application, claims 64, 66, 68, 70, 73, 125, 126, 130, 131, 135, 137, 138, 140, 157, 161, 169, 171, 218, 221, 225, 229, 231-234, 236, 241 and 271-274 remain withdrawn as they are drawn to non-elected inventions. Thus, claims 1, 46, 56-58, 61 and 133 in part are now under consideration

Objections and rejections not reiterated from previous action are hereby withdrawn.

***Maintained-Claim Objections***

Claim 133 contains non-elected subject matter such as immobilized polypeptide (depending from non-elected claim 73), the heterodimer (depending from non-elected claim 126), the antibody (depending from non-elected claim 135). Appropriate correction is required.

Art Unit: 1652

As argued by the examiner above, the instant amendments to claims do not rectify the objections and therefore the objection is maintained.

***Maintained-Claim Rejections: 35 USC § 112***

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

***Enablement***

Claims 1, 46, 56-58, 61 and 133 are rejected under 35 U.S.C. 112, first paragraph, because the specification while being enabling for an isolated polynucleotide of SEQ ID NO: 7 encoding the polypeptide of SEQ ID NO: 8 having amylase activity, or a polynucleotide sequence that hybridizes under defined stringent conditions (as in claims 1 and 46) to SEQ D NO: 7 and encodes a polypeptide with amylase activity, isolated host cells comprising the polynucleotide (as in claim 61) and a micro-array comprising said polynucleotide (as in claim 133), does not reasonably provide enablement for any isolated polynucleotide having at least 95% nucleic acid sequence identity with polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having an amylase activity (as in claims 1 and 46) or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities) as recited in claim 1 (g), or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1 (g), vectors (as in claims 56-58), host cells

Art Unit: 1652

comprising said polynucleotides (as in claim 61) and a micro-array comprising said polynucleotides (as in claim 133). The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to use the invention commensurate in scope with these claims.

Factors to be considered in determining whether undue experimentation is required are summarized in *In re Wands* (858 F.2d 731, 8 USPQ 2nd 1400 (Fed. Cir. 1988)) as follows: (1) the quantity of experimentation necessary, (2) the amount of direction or guidance presented, (3) the presence or absence of working examples, (4) the nature of the invention, (5) the state of the prior art, (6) the relative skill of those in the art, (7) the predictability or unpredictability of the art, and (8) the breadth of the claim(s).

***The breadth of the claim:*** Since the amino acid sequence of a protein determines its structural and functional properties, predictability of which changes can be tolerated in a protein's amino acid sequence and obtain the desired activity requires knowledge and guidance with regard to which amino acids in the protein's sequence and the respective codons in its polynucleotide, if any, are tolerant of modification and which are conserved (i.e. expectedly intolerant to modification), and detailed knowledge of the ways in which the encoded proteins' structure relates to its function or guidance regarding variants/mutants or fragments of polypeptide of SEQ ID NO: 8 having several distinct activities.

Claims 1, 46, 56-58, 61 and 133 are so broad as to encompass any isolated polynucleotide having at least 95% nucleic acid sequence identity with polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having an

Art Unit: 1652

amylase activity (as in claims 1 and 46) or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities) as recited in claim 1(g), or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1(g), especially claim 1, part (d) is so broad as to encompass "a nucleic acid sequence encoding an enzymatically active fragment thereof, wherein in the polypeptide or fragment thereof has amylase activity" and is being interpreted by the examiner as follows: It should be noted that part (d) of claim 1 has been interpreted as being directed to a nucleic acid sequence encoding a polypeptide of SEQ ID NO: 8 or an enzymatically active fragment thereof, in broadest reasonable interpretation encompasses not only SEQ ID NO: 8 but any fragment within SEQ ID NO: 8 due to the recitation of "a" and "fragment thereof". It is deemed to encompass and read on "any two/dipeptide sequences of SEQ ID NO: 8, vectors (as in claims 56-58), host cells comprising said polynucleotides (as in claim 61) and a micro-array comprising said polynucleotides (as in claim 133). The scope of the claims is not commensurate with the enablement provided by the disclosure with regard to the extremely large number of polynucleotides and encoded polypeptides broadly encompassed by the claims. Since the amino acid sequence of a protein encoded by a polynucleotide determines its structural and functional properties, predictability of which changes can be tolerated in a protein's amino acid sequence and obtain

Art Unit: 1652

the desired activity requires a knowledge of and guidance with regard to which amino acids in the protein's sequence and the respective codons in its polynucleotide, if any, are tolerant of modification and which are conserved (i.e. expectedly intolerant to modification), and detailed knowledge of the ways in which the encoded proteins' structure relates to its function. However, in this case the disclosure is limited to an isolated polynucleotide of SEQ ID NO: 7 encoding a polypeptide having amylase activity, or a polynucleotide sequence that hybridizes under defined stringent conditions (as in claims 1 and 46) to SEQ ID NO: 7 and encodes a polypeptide of SEQ ID NO: 8 with amylase activity, isolated host cells comprising the polynucleotide (as in claim 61) and a microarray comprising said polynucleotide (as in claim 133). It would require undue experimentation of the skilled artisan to make and use the claimed polynucleotides and encoding polypeptides that are having at least 95% nucleic acid sequence identity with the nucleic acid sequence of SEQ ID NO: 7 or a portion thereof and said polynucleotides encoding a polypeptide having an amylase activity comprising hydrolyzing glucosidic bonds and catalytic activity features (several distinct activities) as recited in claim 1(g) or a polynucleotide encoding enzymatically active fragment thereof of SEQ ID NO: 8 wherein the fragments inherently possess all the catalytic activity features as recited in claim 1(g). The specification is limited to teaching the use of a polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having amylase activity or a polynucleotide encoding an amino acid sequence of SEQ ID NO: 8, but provides no guidance with regard to the making of variants and mutants or with regard to

Art Unit: 1652

other uses. In view of the great breadth of the claims, amount of experimentation required to make and use the claimed polynucleotides and encoded polypeptides, the lack of guidance, working examples, and unpredictability of the art in predicting function from a polypeptide primary structure (for example, see Whisstock et al., Prediction of protein function from protein sequence and structure. Q Rev Biophys. 2003, Aug. 36 (3): 307-340. Review), the claimed invention would require undue experimentation. As such, the specification fails to teach one of ordinary skill how to use the full scope of the polypeptides encompassed by this claim.

While enzyme isolation techniques, recombinant and mutagenesis techniques are known, and it is not routine in the art to screen for multiple substitutions or multiple modifications as encompassed by the instant claims, the specific amino acid positions within a protein's sequence where amino acid modifications can be made with a reasonable expectation of success in obtaining the desired activity/utility are limited in any protein and the result of such modifications is unpredictable. In addition, one skilled in the art would expect any tolerance to modification for a given protein to diminish with each further and additional modification, e.g. multiple substitutions.

The specification does not support the broad scope of the claims which encompass any isolated polynucleotide having at least 95% nucleic acid sequence identity with polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having an amylase activity (as in claims 1 and 46) or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an

Art Unit: 1652

activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities) as recited in claim 1 (g), or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1 (g), vectors (as in claims 56-58), host cells comprising said polynucleotides (as in claim 61) and a micro-array comprising said polynucleotides (as in claim 133), because the specification does not establish: (A) a rational and predictable scheme for modifying specific nucleotides in the polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having an amylase activity and said polynucleotide sequences hybridizing under defined stringent conditions and encodes a polypeptide with an amylase activity or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities) or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited; (B) regions of the protein/polynucleotide structure which may be modified without affecting the desired biological activity of the encoded polypeptide; (C) the general tolerance of the polypeptide and the encoding polynucleotide to modification and extent of such tolerance; (D) a rational and predictable scheme for modifying any amino acid residue or the respective codon in the polynucleotide with an expectation of obtaining the desired biological activity; (E) defined core regions/motifs involved

Art Unit: 1652

in the desired biological activity of the polypeptide; (F) the tertiary structure of the molecule and folding patterns that are essential for the desired biological activity and tolerance to modifications; and (G) the specification provides insufficient guidance as to which of the essentially infinite possible choices is likely to be successful.

Furthermore, the art teaches that the different activities such as  $\alpha$ -amylase or  $\beta$ -amylase or glucoamylase or exoamylase activities are distinct enzymatic reactions/catalysis and said activities are encompassed in distinct polypeptides or distinct motifs and domains encoded by distinct polynucleotides having distinct structures and applicants' have not provided guidance regarding modifying the nucleic acid structure of SEQ ID NO: 7, such that said variant encodes a polypeptide with all the several distinct activities.

Thus, applicants have not provided sufficient guidance to enable one of ordinary skill in the art to make and use the claimed invention in a manner reasonably correlated with the scope of the claims broadly including polynucleotides and polypeptides with an enormous number of modifications. The scope of the claim must bear a reasonable correlation with the scope of enablement (*In re Fisher*, 166 USPQ 19 24 (CCPA 1975)). Without sufficient guidance, determination of polynucleotides and polypeptides having the desired biological characteristics is unpredictable and the experimentation left to those skilled in the art is unnecessarily, and improperly, extensive and undue. See *In re Wands* 858 F.2d 731, 8 USPQ2d 1400 (Fed. Cir, 1988).

Claim 61 (directed to a transformed cell comprising the vector of claim 57 or the nucleic acid of claim 1, wherein the cell is a mammalian cell) is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement, because, while claim 61 is enabling for an isolated host cell transformed with the synthetic nucleic acid as claimed, does not reasonably provide enablement for transgenic multi-cellular organisms or host cells within a multi-cellular organism that have been transformed with the synthetic nucleic acid. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention commensurate in scope with the claim.

Claim 61 in part is so broad as to encompass transgenic multi-cellular organisms and host cells transformed with specific nucleic acids, including cells *in vitro* culture as well as within any multi-cellular organism. The scope of the claim is not commensurate with the enablement provided by the disclosure with regard to extremely large number of transformed organisms broadly encompassed by the claims. While methods for transforming cells *in vitro* are well known in the art, methods for successfully transforming cells within complex multi-cellular organisms are not routine and are highly unpredictable. Furthermore, methods for producing a successfully transformed cell within the multi-cellular organism are unlikely to be applicable to transformation of other types of multi-cellular organism as multi-cellular organisms vary widely. However, in this case the disclosure is limited to only host cells *in vitro*. Thus, applicants have not provided sufficient guidance to enable one of ordinary skill in the art to

Art Unit: 1652

make and use the claimed invention in a manner reasonably correlated with the scope of the claims broadly including the use of host cells within a multi-cellular organism for the production of polypeptide. The scope of claims must bear a reasonable correlation with the scope of enablement (*In re Fisher*, 166 USPQ 19 24 (CCPA)). Without sufficient guidance, expression of genes in a particular host cell and having the desired biological characteristics is unpredictable, the experimentation left to those skilled in the art is unnecessarily, and improperly, extensive and undue. See *In re Wands* 858 F. 2d 731, 8 USPQ 2<sup>nd</sup> 1400 (Fed. Cir., 1988). It is suggested that the applicants limit the claim to " An isolated recombinant host cell ...".

In support of their request that the prior rejection of claims 1, 46, 56-58, 61 and 133, under 35 U.S.C. 112, first paragraph for enablement be withdrawn, applicants' provide the following arguments.

The search performed by the Office was on the incorrect version of SEQ ID NO: 7. Applicants respectfully request that the issue of enablement be held in abeyance pending entry of the instant amendment, the outcome of the search and examination of the originally filed (correct) version of SEQ ID NO: 7 (1866 nucleotides)

Reply: These arguments are not found to be persuasive for the following reasons.

Examiner for the record would like to reiterate the search was performed on the sequences submitted by the applicants and have acknowledged that

Art Unit: 1652

applicants had inadvertently submitted the wrong set of sequence in the National Phase of the application.

Examiner acknowledges the amendments made to claims and new sequence search, however, the broadest interpretation of claims encompasses a genus of mutant/variant polynucleotides of SEQ ID NO: 7 and encoding polypeptides with any structure with the associated functions: an amylase having several distinct activities and clearly constitutes undue experimentation for a skilled artisan, as the skilled artisan would be required to make and test an essentially unlimited number of "undefined structural derivatives thereof" mutants, variants and recombinants of SEQ ID NO: 7. Specification provides guidance for a polynucleotide of SEQ ID NO: 7 encoding a defined structure i.e., only the full length polypeptide of SEQ ID NO: 8 and the remainder of the structures necessary for the desired function (several distinct activities) are undefined, such as fragments of SEQ ID NO: 8 having several distinct activities as defined in claim 1 part (g). Examiner would like to reiterate that to determine the effect of structural modification on the activity of any polynucleotide of SEQ ID NO: 7 and encoding polypeptide of SEQ ID NO: 8 having several distinct activities, a skilled artisan should be provided with details and guidance regarding the how the structure of any polynucleotide encoding a fragment of polypeptide SEQ ID NO: 8 is correlated with its activity. In addition, the specification has not provided structure-function correlation and tolerance of any modified polypeptide having a fragment of SEQ ID NO: 8 to maintain the required configuration of the molecule and the associated function i.e., several distinct

Art Unit: 1652

activities as in claim 1 part (g). Therefore, the specification does not provide support for the full scope and breadth of the claims.

***Maintained-Written Description***

Claims 1, 46, 56-58, 61 and 133 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Claims 1, 46, 56-58, 61 and 133, as interpreted, are directed to a genus of nucleic acids wherein said nucleic acids encompass a large number of variant polynucleotides encoding polypeptides of any function or several distinct activities; i.e., any isolated polynucleotide having at least 95% nucleic acid sequence identity with polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having an amylase activity (as in claims 1 and 46) or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities) as recited in claim 1(g), or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1(g), especially claim 1, part (d) is so broad as to encompass "a nucleic acid sequence encoding an enzymatically active fragment thereof, wherein in the polypeptide or fragment thereof has

Art Unit: 1652

amylase activity" and is being interpreted by the examiner as follows: It should be noted that part (d) of claim 1 has been interpreted as being directed to a nucleic acid sequence encoding a polypeptide of SEQ ID NO: 8 or an enzymatically active fragment thereof, in broadest reasonable interpretation encompasses not only SEQ ID NO: 8 but any fragment within SEQ ID NO: 8 due to the recitation of "a" and "fragment thereof". It is deemed to encompass and read on "any two/dipeptide sequences of SEQ ID NO: 8, vectors (as in claims 56-58), host cells comprising said polynucleotides (as in claim 61) and a micro-array comprising said polynucleotides (as in claim 133).

As discussed in the enablement rejection above, the art teaches that the different activities such as  $\alpha$ -amylase or  $\beta$ -amylase or glucoamylase or exoamylase activities are distinct enzymatic reactions/catalysis and said activities are encompassed in distinct polypeptide structures (motifs and domains) encoded by distinct polynucleotides having distinct structures and applicants' have not provided description of the variants of SEQ ID NO: 7 encoding a polypeptide with all the several distinct activities or a fragment of the polypeptide sequence of SEQ ID NO: 8 having all the several distinct activities.

In *University of California v. Eli Lilly & Co.*, 43 USPQ2d 1938, the Court of Appeals for the Federal Circuit has held that "A written description of an invention involving a chemical genus, like a description of a chemical species, 'requires a precise definition, such as by structure, formula, [or] chemical name,' of the claimed subject matter sufficient to distinguish it from other materials". As indicated in MPEP § 2163, the written description requirement for a claimed genus may be satisfied through sufficient description of a representative number of species by actual reduction to practice, reduction to drawings, or by disclosure of relevant, identifying characteristics, i.e., structure or other physical and/or chemical properties, by functional characteristics coupled with a known or disclosed correlation between function and structure, or by a combination of such

Art Unit: 1652

identifying characteristics, sufficient to show that Applicant was in possession of the claimed genus. In addition, MPEP § 2163 states that a representative number of species means that the species which are adequately described are representative of the entire genus. Thus, when there is substantial variation within the genus, one must describe a sufficient variety of species to reflect the variation within the genus.

In the instant case, there are no structural limitations or structure-function correlationship recited in claims with regard to the members of the genus of polynucleotides and encoded polypeptides claimed in claim 1, 46, 56-58, 61 and 133 (several distinct activities) i.e., a genus of nucleic acids wherein said nucleic acids encompass a large number of variant polynucleotides encoding polypeptides of any function or several distinct activities wherein said isolated polynucleotide having at least 95% nucleic acid sequence identity with polynucleotide sequence of SEQ ID NO: 7 encoding a polypeptide having an amylase activity and said polynucleotide sequences hybridizing under defined stringent conditions to SEQ ID NO: 7 or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities) as recited in claim 1(g), or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1(g), vectors, host cells and micro-arrays comprising said polynucleotides.

A sufficient written description of a genus of polynucleotides may be achieved by a recitation of a representative number of polynucleotides defined by

Art Unit: 1652

their nucleotide sequence or a recitation of structure-function correlated features common to members of the genus, which features constitute a substantial portion of the genus. However, in the instant case, the genus of nucleic acids wherein said nucleic acids encompass a large number of variant polynucleotides encoding polypeptides of any function or several distinct activities. While the specification in the instant application discloses the structure of an isolated polynucleotide of SEQ ID NO: 7 encoding a polypeptide having amylase activity, or a polynucleotide sequence that hybridizes under defined stringent conditions to SEQ ID NO: 7 and encodes a polypeptide of SEQ ID NO: 8 with an amylase activity, isolated host cells and micro-array comprising the polynucleotide and said polynucleotide (SEQ ID NO: 7) is not representative of the structure and function of all members of the claimed genus. The specification fails to disclose by any relevant, identifying characteristics or functional properties of all the members of the genus i.e., any information as to the structures associated with functions (several distinct activities) i.e., a genus of nucleic acids wherein said nucleic acids encompass a large number of variant polynucleotides encoding polypeptides of any function or several distinct activities wherein said isolated polynucleotide having at least 95% nucleic acid sequence identity with polynucleotide sequence of SEQ ID NO: 7 or said polynucleotide sequence encoding enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1(g)], vectors, host cells comprising said polynucleotides.

The genus of polynucleotides and encoding polypeptides required in the claimed invention is an extremely large structurally and functionally variable genus. While the argument can be made that the recited genus of polynucleotides is adequately described by the disclosure of the structure of an isolated polynucleotide of SEQ ID NO: 7 encoding a polypeptide having an amylase activity, or a polynucleotide sequence that hybridizes under defined stringent conditions and encodes a polypeptide with an amylase activity having an amino acid sequence of SEQ ID NO: 8, since one could use structural homology to isolate those polynucleotide and encoding polypeptides recited in the claims. As taught by the art, even highly structurally homologous polynucleotides and encoded polypeptides do not necessarily share the same function. For example, Witkowski et al., (Biochemistry 38:11643-11650, 1999), teaches that one conservative amino acid substitution transforms a  $\alpha$ - $\beta$ -ketoacyl synthase into a malonyl decarboxylase and completely eliminates  $\alpha$ - $\beta$ -ketoacyl synthase activity. Seffernick et al., (J. Bacteriol. 183(8): 2405-2410, 2001), teaches that two naturally occurring *Pseudomonas* enzymes having 98% amino acid sequence identity catalyze two different reactions: deamination and dehalogenation, therefore having different function. Broun et al., (Science 282:1315-1317, 1998), teaches that as few as four amino acid substitutions can convert an oleate 12-desaturase into a hydrolase and as few as six amino acid substitutions can transform a hydrolase to a desaturase. Therefore, the claimed genera of polynucleotides include encoding polypeptides having widely variable structure and associated functions, since minor changes in structure may result

Art Unit: 1652

in changes affecting function and no additional information correlating structure with several distinct functions has been provided.

Due to the fact that the specification only discloses an isolated polynucleotide of SEQ ID NO: 7 encoding a polypeptide having an amylase activity, or a polynucleotide sequence that hybridizes under defined stringent conditions to SEQ D NO: 7 and encodes a polypeptide with amylase activity, isolated host cells and a micro-array comprising the polynucleotide, and the lack of description of any additional species/variants/mutants/recombinants by any relevant, identifying characteristics or properties or structure-function relationship for the cited several distinct functions/activities, one of skill in the art would not recognize from the disclosure that applicant was in possession of the claimed invention.

Applicant is referred to the revised guidelines concerning compliance with the written description requirement of U.S.C. 112, first paragraph, published in the Official Gazette and also available at [www.uspto.gov](http://www.uspto.gov).

In support of their request that the prior rejection of claims 1, 46, 56-58, 61 and 133 under 35 U.S.C. 112, first paragraph, for insufficient written description be withdrawn applicants' provide the following argument that are very similar to the arguments provided for traversing the enablement rejection.

The search performed by the Office was on the incorrect version of SEQ ID NO: 7. Applicants respectfully request that the issue of written description be held in abeyance pending entry of the instant amendment, the outcome of the

Art Unit: 1652

search and examination of the originally filed (correct) version of SEQ ID NO: 7 (1866 nucleotides)

Reply: These arguments are not found to be persuasive for the following reasons.

Examiner for the record would like to reiterate the search was performed on the sequences submitted by the applicants and have acknowledged that applicants had inadvertently submitted the wrong set of sequence in the National Phase of the application.

However, as argued above (see enablement rejection above), the broadest interpretation of claims encompasses a genus of mutant/variant polynucleotides of SEQ ID NO: 7 and encoding polypeptides with any structure with the associated functions: an amylase having several distinct activities and therefore the specification provides only a single species i.e., an isolated polynucleotide of SEQ ID NO: 7 encoding a full-length polypeptide of SEQ ID NO: 8 with amylase activity of the recited genus, which is insufficient to put one of ordinary skill in the art in possession of all attributes and features of all species within the required genus. Examiner continues to hold the position that the genus of polypeptides required in the claimed invention is an extremely large structurally variable genus, and thus claimed genus encompasses an essentially unlimited number of "undefined structural derivatives thereof" mutants, variants of any function or several distinct activities wherein said isolated polynucleotide having at least 95% nucleic acid sequence identity with an isolated polynucleotide of SEQ ID NO: 7 or said polynucleotide sequence encoding

Art Unit: 1652

enzymatically active fragments thereof of SEQ ID NO: 8 (as in claim 1 (d)) wherein said fragments of SEQ ID NO: 8 inherently has all the catalytic activity features as recited in claim 1(g)], vectors, host cells comprising said polynucleotides.

For these reasons, claims 1, 46, 56-58, 61 and 133 are rejected under 35 U.S.C. 112, first paragraph for written-description.

***New-Claim Rejections 35 USC § 102***

Applicants' amendments to the claims have necessitated the introduction of a new rejection.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 46, 56-58 and 61 in part are rejected under 35 U.S.C. 102(b) as being anticipated by Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073), because broadest interpretation of claims, especially claim 1, part (d) "a nucleic acid sequence encoding an enzymatically active fragment thereof, wherein in the polypeptide or fragment thereof has amylase activity" is being interpreted by the examiner as follows: It should be noted that part (d) of claim 1 being directed to a nucleic acid sequence encoding a polypeptide of SEQ ID NO: 8 or an enzymatically active fragment thereof, in broadest reasonable interpretation encompasses not only SEQ ID NO: 8 but any fragment within SEQ ID NO: 8 due to the recitation of "a" and "fragment thereof". It is deemed to encompass and

Art Unit: 1652

read on "any two/dipeptide sequences of SEQ ID NO: 8. Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073) disclose the isolation of an isolated polynucleotide encoding a polypeptide (Q59005) annotated as a putative amylase/glycosidase belonging to glycosyl hydrolase 15 family with glycosyl hydrolase activity (entire document and see provided sequence alignment), said reference polypeptide comprises many fragments of SEQ ID NO: 8 of the instant application and the recited activity of claim 1 part (g), for example, the following amino acid residues/fragments of the reference polypeptide (Q59005); 111-122 and 517-537 correspond to the fragment (100% best local similarity to SEQ ID NO: 8 or enzymatically active fragment thereof) found in SEQ ID NO: 8 of the instant application at positions 109-120 and 519-540. Therefore, the disclosure of Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073) is deemed to anticipate claims 1, 46, 56-58 and 61 in part of the instant application.

In support of their request that the prior rejection of claims 1, 46, 56-58 and 61 in part under 35 U.S.C. 102(b) be withdrawn applicants' provide the following argument.

The search performed by the Office was on the incorrect version of SEQ ID NO: 7. Applicants respectfully request that the rejection under 35 U.S.C. 102(b) be held in abeyance pending entry of the instant amendment, the outcome of the search and examination of the originally filed (correct) version of SEQ ID NO: 7 (1866 nucleotides)

Reply: These arguments are not found to be persuasive for the following reasons.

Examiner for the record would like to reiterate the search was performed on the sequences submitted by the applicants and have acknowledged that applicants had inadvertently submitted the wrong set of sequence in the National Phase of the application.

Furthermore, broadest interpretation of claims, especially claim 1, part (d) "a nucleic acid sequence encoding an enzymatically active fragment thereof, wherein in the polypeptide or fragment thereof has amylase activity" is being interpreted by the examiner as follows: It should be noted that part (d) of claim 1 being directed to a nucleic acid sequence encoding a polypeptide of SEQ ID NO: 8 or an enzymatically active fragment thereof, in broadest reasonable interpretation encompasses not only SEQ ID NO: 8 but any fragment within SEQ ID NO: 8 due to the recitation of "a" and 'fragment thereof'. It is deemed to encompass and read on "any two/dipeptide sequences of SEQ ID NO: 8 and therefore anticipated by Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073).

***New-Claim Rejections 35 USC § 103***

Applicants' amendments to the claims have necessitated the introduction of a new obviousness rejection.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a

Art Unit: 1652

later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 46, 56-58 and 61 in part are rejected under 35 U.S.C. 103(a) as being unpatentable over Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073). The teachings of Bult et al., are described above (see 102 (b) rejection). Although Bult et al., teach the isolation of an isolated polynucleotide encoding a polypeptide (Q59005) annotated as a putative amylase/glycosidase belonging to glycosyl hydrolase 15 family with glycosyl hydrolase activity (entire document and see provided sequence alignment), said reference polypeptide comprises many fragments of SEQ ID NO: 8 of the instant application and the recited activity of claim 1 part (g), for example, the following amino acid residues/fragments of the reference polypeptide (Q59005); 111-122 and 517-537 correspond to the fragment (100% best local similarity to SEQ ID NO: 8 or enzymatically active fragment thereof) found in SEQ ID NO: 8 of the instant application at positions 109-120 and 519-540, said reference is silent regarding said nucleic acid further comprising a sequence encoding a heterologous polypeptide sequence (as in claim 1 (h) to (k)).

The many advantages of recombinant production of useful proteins are well known within the art (for example, see Chapters 1-3, 16 and Vectors-Appendix 5 in Current Protocols in Molecular Biology, Ed., Ausubel et al., Published by John Wiley and Sons, New York, NY, USA, 1990), as are recombinant methods of obtaining the necessary genes. These advantages include a) the ability to produce much larger quantities of the protein cloned into suitable expression vectors, b) being able to produce the protein in more easily handled organisms

Art Unit: 1652

(host cells), c) construction of fusion proteins with suitable tags/heterologous polypeptides for easy detection and purification of expressed proteins, d) appropriate targeting of expressed polypeptides to the sub-cellular compartment of interest in the host cell of interest by expressing said polypeptide as a fusion protein comprising heterologous signals such as leader sequences, e) for reducing the number of steps necessary for the purification of a protein and f) producing the protein in a purer form by using an organism that does not include naturally occurring contaminants of the protein. As such disclosure of a polynucleotide encoding a useful polypeptide such as that of Bult et al., clearly suggests to a skilled artisan to produce large quantities of the said protein comprising appropriate heterologous sequences such as tags, epitopes or leader sequences depending on the experimental need.

Therefore, it would have been obvious to one of ordinary skill in the art to isolate and express any isolated polynucleotide having at least 95% nucleic acid sequence identity with an isolated polynucleotide of SEQ ID NO: 7 encoding a polypeptide having an amylase activity or enzymatically active fragments wherein said polynucleotides encodes polypeptides having an activity comprising hydrolyzing glucosidic bonds and all the catalytic activity features (several distinct activities), vectors, host cells comprising said polynucleotides and as disclosed by Bult et al., using well known recombinant methods for the isolation of such genes, insertion of the isolated gene into a suitable expression vector comprising a nucleic acid encoding a heterologous polypeptide (as in claim 1 (f) to (i)),

Art Unit: 1652

introducing said vector comprising said nucleic acids into suitable host cells for a method of producing said polypeptides (as in claims 46, 56-58 and 61).

Claims 1, 46, 56-58, 61 and 133 in part are rejected under 35 U.S.C. 103(a) as being unpatentable over Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073) and in view of Brown et al., (Nature Genetics, 1999, Vol. 21: 33-37). The teachings of Bult et al., are described above (see 102 (b) rejection). Although Bult et al., teach the isolation of an isolated polynucleotide encoding a polypeptide (Q59005) annotated as a putative amylase/glycosidase belonging to glycosyl hydrolase 15 family with glycosyl hydrolase activity (entire document and see provided sequence alignment), said reference polypeptide comprises many fragments of SEQ ID NO: 8 of the instant application and the recited activity of claim 1 part (g), for example, the following amino acid residues/fragments of the reference polypeptide (Q59005); 111-122 and 517-537 correspond to the fragment (100% best local similarity to SEQ ID NO: 8 or enzymatically active fragment thereof) found in SEQ ID NO: 8 of the instant application at positions 109-120 and 519-540, said reference is silent regarding an array i.e., said polynucleotide immobilized on a suitable matrix. Brown et al., teach the use of DNA micro-arrays as a vehicle for exploration for carrying out genome-wide surveys of gene expression patterns or functions that involves arraying discrete genes of interest (polynucleotide sequences) immobilized on a suitable matrix (Abstract section and entire document). It would have been obvious to a person of ordinary skill in the art to combine the teachings of Bult et al., and Brown et al., to produce an array comprising the polynucleotide

Art Unit: 1652

sequence of SEQ ID NO: 7 and motivation to do so derives from the use of DNA micro-arrays for exploring at a molecular level, expression, function and the occurrence of polynucleotide sequences having homology to SEQ ID NO: 7 in other organisms i.e., genome-wide surveys of gene expression patterns or functions with DNA-micro-arrays (Brown et al.,). The expectation of success is high for producing an array comprising the immobilized sequence of SEQ ID NO: 7, because Bult et al., teach isolated polynucleotide encoding a polypeptide (Q59005) annotated as a putative amylase/glycosidase belonging to glycosyl hydrolase 15 family with glycosyl hydrolase activity (entire document and see provided sequence alignment), said reference polypeptide comprises many fragments of SEQ ID NO: 8 of the instant application and the recited activity of claim 1 part (g), for example, the following amino acid residues/fragments of the reference polypeptide (Q59005); 111-122 and 517-537 correspond to the fragment (100% best local similarity to SEQ ID NO: 8 or enzymatically active fragment thereof) found in SEQ ID NO: 8 of the instant application at positions 109-120 and 519-540 of the instant application and Brown et al., teach the use of DNA micro-arrays as a vehicle for exploration for carrying out genome-wide surveys of gene expression patterns or functions, that involves arraying discrete genes of interest (polynucleotide sequences) immobilized on a suitable matrix. Therefore, claims 1, 46, 56-58, 61 in part and 133 in part are rejected under 35 U.S.C. 103(a) as being unpatentable over Bult et al., (Science, 1996, Vol. 273 (5278): 1058-1073) and in view of Brown et al., (Nature Genetics, 1999, Vol. 21: 33-37).

Art Unit: 1652

In support of their request that the prior rejection of claims 1, 46, 56-58 61 and 133 under 35 U.S.C. 35 U.S.C. 103(a) be withdrawn applicants' provide the following argument.

The search performed by the Office was on the incorrect version of SEQ ID NO: 7. Applicants respectfully request that the rejection under 35 U.S.C. 102(b) be held in abeyance pending entry of the instant amendment, the outcome of the search and examination of the originally filed (correct) version of SEQ ID NO: 7 (1866 nucleotides)

Reply: These arguments are not found to be persuasive for the following reasons.

Examiner for the record would like to reiterate the search was performed on the sequences submitted by the applicants and have acknowledged that applicants had inadvertently submitted the wrong set of sequence in the National Phase of the application.

Examiner continues to hold that examiner has provided unequivocal evidence for combining the cited references and that the cited references have been properly applied in this obviousness rejection in accordance with the factual enquires set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966) and the rationale for TSM test (Teaching, Suggestion and Motivation) according to KSR ruling. Furthermore the cited references teach all the limitations of the instant claims.

The cited references render claims 1, 46, 56-58 61 and 133 *prima facie* obvious to one of ordinary skill in the art when one applies the Teaching,

Art Unit: 1652

Suggestion and Motivation (TSM) test under the rationale for arriving at a conclusion of obviousness as suggested by the KSR ruling.

***Allowable Subject Matter/Conclusion***

None of the claims are allowable.

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

***Final Comments***

To insure that each document is properly filed in the electronic file wrapper, it is requested that each of amendments to the specification, amendments to the claims, Applicants' remarks, requests for extension of time, and any other distinct papers be submitted on separate pages.

Art Unit: 1652

It is also requested that Applicants identify support, within the original application, for any amendments to the claims and specification.
